

# SINGULAR VALUE DECOMPOSITION

DR. MATTHIEU R BLOCH

Wednesday, November 10, 2021

# LOGISTICS

---

## General announcements

- Assignment 6 to be posted tonight
- 8 lectures left!

## Midterm 2:

- Grading starting, we'll keep you posted

# WHAT'S ON THE AGENDA FOR TODAY?

Last time:

- Singular value decomposition

Today

- More singular value decomposition
- Application to solving least squares

Reading: lecture notes 13/14

Toddlers can do it!

# SINGULAR VALUE DECOMPOSITION

What happens for non-square matrices?

## Theorem (Singular value decomposition)

Let  $\mathbf{A} \in \mathbb{R}^{m \times n}$  with  $\text{rank}(\mathbf{A}) = r$ . Then  $\mathbf{A} = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^T$  where

- $\mathbf{U} \in \mathbb{R}^{m \times r}$  such that  $\mathbf{U}^T\mathbf{U} = \mathbf{I}_r$  (orthonormal columns)
- $\mathbf{V} \in \mathbb{R}^{n \times r}$  such that  $\mathbf{V}^T\mathbf{V} = \mathbf{I}_r$  (orthonormal columns)
- $\mathbf{\Sigma} \in \mathbb{R}^{r \times r}$  is diagonal with *positive entries*

$(\mathbf{U}\mathbf{U}^T \neq \mathbf{I})$   
 $(\mathbf{V}\mathbf{V}^T \neq \mathbf{I})$

$\mathbf{U} = \begin{bmatrix} | & & | \\ \mathbf{u}_1 & \dots & \mathbf{u}_r \\ | & & | \end{bmatrix}$   $\mathbf{u}_i^T \mathbf{u}_j = 0$   $\mathbf{u}_i^T \mathbf{u}_i = 1$

$$\mathbf{\Sigma} \triangleq \begin{bmatrix} \sigma_1 & 0 & 0 & \dots \\ 0 & \sigma_2 & 0 & \dots \\ \vdots & & \ddots & \\ 0 & \dots & \dots & \sigma_r \end{bmatrix}$$

and  $\sigma_1 \geq \sigma_2 \geq \dots \geq \sigma_r \geq 0$ . The  $\sigma_i$  are called the *singular values*

We say that  $\mathbf{A}$  is full rank if  $r = \min(m, n)$

We can write  $\mathbf{A} = \sum_{i=1}^r \sigma_i \mathbf{u}_i \mathbf{v}_i^T$

We can write  $\mathbf{A} = \sum_{i=1}^r \sigma_i \mathbf{u}_i \mathbf{v}_i^T$

Hence  $U(U^T A V)V^T = (U, U_0^T) A (V, V_0^T) = A = U, \Sigma, V, V_0^T$

$$= \begin{bmatrix} U & U_0 \\ \hline \end{bmatrix} \begin{bmatrix} \sqrt{\lambda_1} & & & \\ & \sqrt{\lambda_r} & & \\ & & 0 & \\ & & & \ddots \\ 0 & & & & 0 \\ \hline & & & & 0 & \\ & & & & & \ddots \\ & & & & & & 0 \end{bmatrix} \begin{bmatrix} V & V_0 \\ \hline \end{bmatrix}^T$$

$\begin{matrix} \xrightarrow{n} \\ \xrightarrow{r} & \xrightarrow{n-r} \\ \xrightarrow{r} & \xrightarrow{m-r} \\ \xrightarrow{r} & \xrightarrow{m-r} \end{matrix}$

$$= U \Sigma V^T \quad \text{w/} \quad \Sigma = \begin{bmatrix} \sqrt{\lambda_1} & & & \\ & \sqrt{\lambda_r} & & \\ & & 0 & \\ & & & \ddots \\ 0 & & & & \sqrt{\lambda_r} \end{bmatrix}$$

The vectors  $\{u_i\}_{i=1}^r$  form a basis for the column space of  $A$

Check: Let's consider the span of  $\{u_i\}_{i=1}^r$ ; note that  $\forall i \in \{1, \dots, r\}$   $u_i = \frac{1}{\sqrt{d_i}} A v_i \in \text{col}(A)$  so that  $\text{span}\{u_i\}_{i=1}^r \subset \text{col}(A)$

By dimension considerations  $\dim(\text{span}\{u_i\}_{i=1}^r) = r = \text{rank}(A) = \dim(\text{col}(A))$  so that  $\text{span}\{u_i\}_{i=1}^r = \text{Col}(A)$

Let  $\{u_i\}_{i=r+1}^m$  be an orthonormal basis of  $\text{Ker}(A^T)$ ; recall that  $\text{Ker}(A^T) = \text{Col}(A)^\perp$  (check using definition + dimension)

Hence  $\{u_i\}_{i=1}^m$  form an orthonormal basis for  $\mathbb{R}^m$

Recall:  $V = \begin{bmatrix} | & & | \\ v_1 & \dots & v_r \\ | & & | \end{bmatrix}$      $U = \begin{bmatrix} | & & | \\ u_1 & \dots & u_r \\ | & & | \end{bmatrix}$

Note  $V^T V = I$     $V_0^T V = 0$     $V^T V_0 = 0$

Define  $V_0 = \begin{bmatrix} | & & | \\ v_{r+1} & \dots & v_m \\ | & & | \end{bmatrix}$      $U_0 = \begin{bmatrix} | & & | \\ u_{r+1} & \dots & u_m \\ | & & | \end{bmatrix}$

$U^T U = I$     $U_0^T U_0 = I$     $U^T U_0 = 0$

Construct  $V = \begin{bmatrix} | & & | \\ \underbrace{v_1 \dots v_r}_r & & \underbrace{v_{r+1} \dots v_m}_{m-r} \\ | & & | \end{bmatrix}$      $U = \begin{bmatrix} | & & | \\ \underbrace{u_1 \dots u_r}_r & & \underbrace{u_{r+1} \dots u_m}_{m-r} \\ | & & | \end{bmatrix}$     such that  $U^T U = U_0^T U_0 = I$  and  $V^T V = V_0^T V_0 = I$

Compute  $(U^T A V)_{ij} = u_i^T A v_j = \frac{1}{\sqrt{d_i}} v_i^T A^T A v_j = \sqrt{d_i} v_i^T v_j = \begin{cases} \sqrt{d_i} & \text{if } i=j \\ 0 & \text{else} \end{cases}$     ( $U^T A V \in \mathbb{R}^{m \times n}$ )

Hence  $U^T A V = \begin{bmatrix} \sqrt{d_1} & & 0 & \dots & 0 \\ & \ddots & & & \\ 0 & & \sqrt{d_r} & & \\ \hline & & & & \\ 0 & & & & \\ & & & & \\ & & & & \end{bmatrix} \begin{matrix} \uparrow \\ m \\ \downarrow \end{matrix} \triangleq \Sigma$

Proof. Start with  $A^T A \in \mathbb{R}^{n \times n}$ , which is symmetric

By the spectral theorem, we have  $A^T A = \sum_{i=1}^n \lambda_i v_i v_i^T$   $\{v_i\}_{i=1}^n$  orthonormal basis of eigenvectors

Note that  $\text{rank}(A) = \text{rank}(A^T A) = r \leq n$  so that  $\lambda_1 \geq \lambda_2 \geq \dots \geq \lambda_r > 0 = \lambda_{r+1} = \dots = \lambda_n$  (recall  $\lambda_i \geq 0 \forall i$ )

Consider  $\{v_i\}_{i=1}^r$ ; they form an orthonormal basis for the column space of  $(A^T A)$ , hence of  $\text{row}(A)$

Consider  $\{v_i\}_{i=r+1}^n$ ; they form an orthonormal basis for the Kernel (null space) of  $A$

Check. ① Since  $\lambda_i = 0$   $A^T A v_i = 0$  for  $i \in \{r+1, \dots, n\}$   
Hence  $v_i \in \text{Ker}(A^T A) = \text{Ker}(A)$ ;  $\text{Span}\{v_i\}_{i=r+1}^n \subset \text{Ker}(A)$

② We have a span of dimension  $n-r$  and  $\dim(\text{Ker}(A)) = n - \text{rank}(A) = n-r$  hence  $\text{span}\{v_i\}_{i=r+1}^n =$

Set  $u_i \stackrel{\Delta}{=} \frac{1}{\sqrt{\lambda_i}} A v_i$  for  $i \in \{1, \dots, r\}$ ; form  $U = \begin{bmatrix} | & & | \\ u_1 & \dots & u_r \\ | & & | \end{bmatrix} \uparrow^r \mathbb{R}^m$ , form  $V = \begin{bmatrix} | & & | \\ v_1 & \dots & v_r \\ | & & | \end{bmatrix} \uparrow^r \mathbb{R}^n$

Note that  $u_j^T u_i = \frac{1}{\sqrt{\lambda_j \lambda_i}} v_j^T A^T A v_i = \frac{1}{\sqrt{\lambda_j \lambda_i}} \lambda_i v_j^T v_i = \sqrt{\frac{\lambda_i}{\lambda_j}} v_j^T v_i = \begin{cases} 1 & \text{if } i=j \\ 0 & \text{else} \end{cases}$

Hence  $U^T U = I$

# IMPORTANT PROPERTIES OF THE SVD

---

The columns of  $\mathbf{V}$   $\{\mathbf{v}_i\}_{i=1}^r$  are eigenvectors of the psd matrix  $\mathbf{A}^T \mathbf{A}$ .  $\{\sigma_i : 1 \leq i \leq n \text{ and } \sigma_i \neq 0\}$  are the square roots of the non-zero eigenvalues of  $\mathbf{A}^T \mathbf{A}$ .

Note: Since  $A = U \Sigma V^T$      $A^T A = V \Sigma U^T U \Sigma V^T = V \Sigma^2 V^T$

# IMPORTANT PROPERTIES OF THE SVD

---

The columns of  $\mathbf{V}$   $\{\mathbf{v}_i\}_{i=1}^r$  are eigenvectors of the psd matrix  $\mathbf{A}^T\mathbf{A}$ .  $\{\sigma_i : 1 \leq i \leq n \text{ and } \sigma_i \neq 0\}$  are the square roots of the non-zero eigenvalues of  $\mathbf{A}^T\mathbf{A}$ .

The columns of  $\mathbf{U}$   $\{\mathbf{u}_i\}_{i=1}^r$  are eigenvectors of the psd matrix  $\mathbf{A}\mathbf{A}^T$ .  $\{\sigma_i : 1 \leq i \leq n \text{ and } \sigma_i \neq 0\}$  are the square roots of the non-zero eigenvalues of  $\mathbf{A}\mathbf{A}^T$ .

Note: 
$$\mathbf{A}\mathbf{A}^T = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^T\mathbf{V}\mathbf{\Sigma}\mathbf{U}^T = \mathbf{U}\mathbf{\Sigma}^2\mathbf{U}^T = \sum_{i=1}^r \sigma_i^2 \mathbf{u}_i \mathbf{u}_i^T$$

# IMPORTANT PROPERTIES OF THE SVD

---

The columns of  $\mathbf{V}$   $\{\mathbf{v}_i\}_{i=1}^r$  are eigenvectors of the psd matrix  $\mathbf{A}^T\mathbf{A}$ .  $\{\sigma_i : 1 \leq i \leq n \text{ and } \sigma_i \neq 0\}$  are the square roots of the non-zero eigenvalues of  $\mathbf{A}^T\mathbf{A}$ .

The columns of  $\mathbf{U}$   $\{\mathbf{u}_i\}_{i=1}^r$  are eigenvectors of the psd matrix  $\mathbf{A}\mathbf{A}^T$ .  $\{\sigma_i : 1 \leq i \leq n \text{ and } \sigma_i \neq 0\}$  are the square roots of the non-zero eigenvalues of  $\mathbf{A}\mathbf{A}^T$ .

The columns of  $\mathbf{V}$  form an orthobasis for  $\text{row}(\mathbf{A})$

The columns of  $\mathbf{U}$  form an orthobasis for  $\text{col}(\mathbf{A})$

Equivalent form of the SVD:  $\mathbf{A} = \tilde{\mathbf{U}}\tilde{\Sigma}\tilde{\mathbf{V}}^T$  where

- $\tilde{\mathbf{U}} \in \mathbb{R}^{m \times m}$  is orthonormal
- $\tilde{\mathbf{V}} \in \mathbb{R}^{n \times n}$  is orthonormal
- $\tilde{\Sigma} \in \mathbb{R}^{m \times n}$  is

$$\tilde{\Sigma} \triangleq \begin{bmatrix} \Sigma & | & \mathbf{0} \\ \hline \mathbf{0} & | & \mathbf{0} \end{bmatrix}$$

# SVD AND LEAST-SQUARES

When we cannot solve  $\mathbf{y} = \mathbf{A}\mathbf{x}$ , we solve instead

$$\min_{\mathbf{x} \in \mathbb{R}^n} \|\mathbf{x}\|_2^2 \text{ such that } \mathbf{A}^\top \mathbf{A}\mathbf{x} = \mathbf{A}^\top \mathbf{y}$$

- This allows us to pick the minimum norm solution among potentially infinitely many solutions of the normal equations.

Recall: when  $\mathbf{A} \in \mathbb{R}^{m \times n}$  is of rank  $n$ , then  $\mathbf{x} = \mathbf{A}^\top (\mathbf{A}\mathbf{A}^\top)^{-1} \mathbf{y}$

**Proposition (General solution)** The solution of

$$\min_{\mathbf{x} \in \mathbb{R}^n} \|\mathbf{x}\|_2^2 \text{ such that } \mathbf{A}^\top \mathbf{A}\mathbf{x} = \mathbf{A}^\top \mathbf{y}$$

is

$$\hat{\mathbf{x}} = \mathbf{V}\mathbf{\Sigma}^{-1}\mathbf{U}^\top \mathbf{y} = \sum_{i=1}^r \frac{1}{\sigma_i} \langle \mathbf{y}, \mathbf{u}_i \rangle \mathbf{v}_i$$

where  $\mathbf{A} = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^\top$  is the SVD of  $\mathbf{A}$ .

Proof. Let  $x \in \mathbb{R}^n$ ; then  $x = \underbrace{V\alpha}_{\in \text{Row}(A)} + \underbrace{V_0\alpha_0}_{\in \text{Col}(A)}$  w/  $V \in V_0$  defined earlier in SVD analysis

$$\text{Hence } V^T x = V^T V \alpha = \alpha \quad \text{and} \quad V_0^T x = V_0^T V_0 \alpha_0 = \alpha_0 \quad ; \quad \|x\|_2^2 = \|V\alpha\|_2^2 + \|V_0\alpha_0\|_2^2 = \alpha^T V^T V \alpha + \alpha_0^T V_0^T V_0 \alpha_0 = \|\alpha\|_2^2 + \|\alpha_0\|_2^2$$

Let  $y \in \mathbb{R}^m$ ; then  $y = \underbrace{U\beta}_{\in \text{Col}(A)} + \underbrace{U_0\beta_0}_{\in \text{Row}(A^T)}$  w/  $U$  and  $U_0$  as before

$$\text{Hence } U^T y = \beta \quad \text{and} \quad U_0^T y = \beta_0 \quad , \quad \|y\|_2^2 = \|\beta\|_2^2 + \|\beta_0\|_2^2$$

$$\text{Then } y - Ax = U\beta + U_0\beta_0 - U\Sigma V^T(V\alpha + V_0\alpha_0) = U\beta + U_0\beta_0 - U\Sigma\alpha = \underbrace{U_0\beta_0}_{\text{orthogonal to } U} + U(\beta - \Sigma\alpha)$$

$$\|y - Ax\|_2^2 = \|\beta_0\|_2^2 + \|\beta - \Sigma\alpha\|_2^2$$

# PSEUDO INVERSE

---

$\mathbf{A}^+ = \mathbf{V}\mathbf{\Sigma}^{-1}\mathbf{U}^T$  is called the *pseudo-inverse*, Lanczos inverse, or Moore-Penrose inverse of  $\mathbf{A} = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^T$ .

If  $\mathbf{A}$  is square invertible then  $\mathbf{A}^+ = \mathbf{A}$

If  $m \geq n$  (tall and skinny matrix) of rank  $n$  then  $\mathbf{A}^+ = (\mathbf{A}^T\mathbf{A})^{-1}\mathbf{A}^T$

If  $m \leq n$  (short and fat matrix) of rank  $m$  then  $\mathbf{A}^+ = \mathbf{A}^T(\mathbf{A}\mathbf{A}^T)^{-1}$

**Note**  $\mathbf{A}^+$  is as “close” to an inverse of  $\mathbf{A}$  as possible

# STABILITY OF LEAST SQUARES

What if we observe  $\mathbf{y} = \mathbf{A}\mathbf{x}_0 + \mathbf{e}$  and we apply the pseudo inverse?  $\hat{\mathbf{x}} = \mathbf{A}^+\mathbf{y}$

We can separate the error analysis into two components

$$\hat{\mathbf{x}} - \mathbf{x}_0 = \underbrace{\mathbf{A}^+\mathbf{A}\mathbf{x}_0 - \mathbf{x}_0}_{\text{null space error}} + \underbrace{\mathbf{A}^+\mathbf{e}}_{\text{noise error}}$$

We will express the error in terms of the SVD  $\mathbf{A} = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^T$  With

- $\{\mathbf{v}_i\}_{i=1}^r$  orthobasis of  $\text{row}(\mathbf{A})$ , augmented by  $\{\mathbf{v}_i\}_{i=1}^{r+1} \in \ker \mathbf{A}$  to form an orthobasis of  $\mathbb{R}^n$
- $\{\mathbf{u}_i\}_{i=1}^r$  orthobasis of  $\text{col}(\mathbf{A})$ , augmented by  $\{\mathbf{u}_i\}_{i=1}^{r+1} \in \ker \mathbf{A}^T$  to form an orthobasis of  $\mathbb{R}^m$

The null space error is given by

$$\|\mathbf{A}^+\mathbf{A}\mathbf{x}_0 - \mathbf{x}_0\|_2^2 = \sum_{i=r+1}^n |\langle \mathbf{v}_i, \mathbf{x}_0 \rangle|^2$$

The noise error is given by

$$\|\mathbf{A}^+\mathbf{e}\|_2^2 = \sum_{i=1}^r \frac{1}{\sigma_i^2} |\langle \mathbf{e}, \mathbf{u}_i \rangle|^2$$

# STABLE RECONSTRUCTION BY TRUNCATION

---

How do we mitigate the effect of small singular values in reconstruction?

$$\hat{\mathbf{x}} = \mathbf{V}\boldsymbol{\Sigma}^{-1}\mathbf{U}^T\mathbf{y} = \sum_{i=1}^r \frac{1}{\sigma_i} \langle \mathbf{y}, \mathbf{u}_i \rangle \mathbf{v}_i$$

Truncate the SVD to  $r' < r$

$$\mathbf{A}_t \triangleq \sum_{i=1}^{r'} \sigma_i \mathbf{u}_i \mathbf{v}_i^T \quad \mathbf{A}_t^+ = \sum_{i=1}^{r'} \frac{1}{\sigma_i} \mathbf{u}_i \mathbf{v}_i^T$$

Reconstruct  $\hat{\mathbf{x}}_t = \sum_{i=1}^{r'} \frac{1}{\sigma_i} \langle \mathbf{y}, \mathbf{u}_i \rangle \mathbf{v}_i = \mathbf{A}_t$

Error analysis:

$$\|\hat{\mathbf{x}}_t\|_2^2 = \sum_{i=r+1}^n |\langle \mathbf{x}_0, \mathbf{v}_i \rangle|^2 + \sum_{i=r'+1}^r |\langle \mathbf{x}_0, \mathbf{v}_i \rangle|^2 + \sum_{i=1}^{r'} \frac{1}{\sigma_i^2} |\langle \mathbf{e}, \mathbf{u}_i \rangle|^2$$

# STABLE RECONSTRUCTION BY REGULARIZATION

---

Regularization means changing the problem to solve

$$\min_{\mathbf{x} \in \mathbb{R}^n} \|\mathbf{y} - \mathbf{A}\mathbf{x}\|_2^2 + \lambda \|\mathbf{x}\|_2^2 \quad \lambda > 0$$

The solution is

$$\hat{\mathbf{x}} = (\mathbf{A}^\top \mathbf{A} + \lambda \mathbf{I})^{-1} \mathbf{A}^\top \mathbf{y} = \mathbf{V}(\boldsymbol{\Sigma}^2 + \lambda \mathbf{I})^{-1} \boldsymbol{\Sigma} \mathbf{U}^\top \mathbf{y}$$
